Hello Nodecraft Hiring Team!

As an active full-stack developer who works daily with Vue 3 Composition API, Typescript, and TailwindCSS, I believe I would be an excellent fit for your Full-Stack Developer position.

I've been a passionate coder since teaching myself BASIC when I was 12 on a TRS-80 my mother scrounged from a yard sale. It had an actual cassette drive and no internet access. My first program was a text-adventure Street Fighter with working Capcom code inputs. At 45, I have personally experienced the evolution of coding frameworks from BASIC to C+ to Ruby to Python to Vue.js. I have 208 GitHub repos that showcase a myriad of coding challenges, online academy assignments, and personal projects, demonstrating my active engagement and continuous learning in this field.

Three years ago, I built an Unraid/Ubuntu 20-hard-drive NAS server to integrate with my smart home, which now routes 10 https domains from Cloudflare through 49 dockerized containers using multiple Mariadb & Redis databases, 154TB of served data, a retro webarcade, audiobooks, my partner's professional wordpress, a digital library, a stable-diffusion art modeler, a media request interface, automated file upgrades, backups, and discord notifications.

My current personal project is a suite of modular chatbots, using Vue 3.2 composition API, Nuxt 3,Tailwind CSS, DaisyUI, Prisma, and MySQL/Mariadb. This was chosen after consciously exploring other options (Laravel/Intertia, Storyblok, Quasar, Options API), until I had a stack that optimized my development workflow. I use git for version control and I'm guided by best practices so my experiences will translate to team development.

Your listing mentioned a need for someone who enjoys refactoring legacy systems. I have enthusiasm for modern code design, and I would enjoy tackling this for NodeCraft, or any other task that could help the company and the team.

I look forward to hearing from you.

Kindly,
Silas Knight
